

## International Year of Crystallography

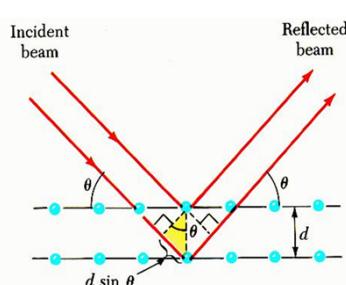

W. L. Bragg

W. L. Bragg

The International Year of Crystallography 2014 (IYCr2014) commemorated the centennial of X-ray diffraction, which allowed the detailed study of crystalline material.

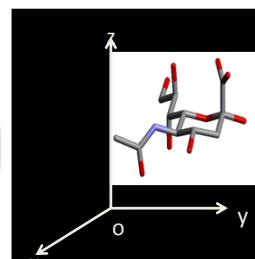

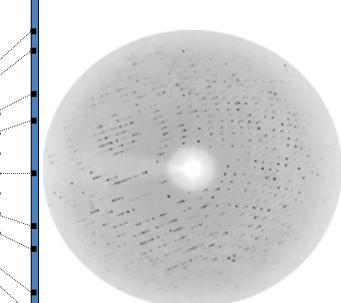

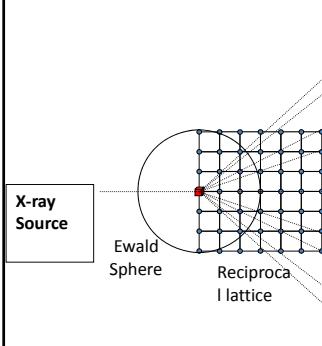

It also commemorated the 400th anniversary of Kepler's observation in 1611 of the symmetrical form of ice crystals, which began the wider study of the role of symmetry in matter.

**X-ray** interact with the spatial distribution of Valence electrons.

**Neutrons** are scattered by the atom nuclei.

**Electrons** feel the influence of both the positively charged atomic nuclei and the surrounding electrons.

N atoms : 3N observables

- X-Ray Fiber Diffraction using Synchrotron and Neutron Radiations
- Electron Diffraction of Polysaccharides

## Molecular & Crystal Structures of Carbohydrates

### Experimental Conditions and Limitations (X and N)

X-ray and Neutron have wavelengths in the same order as the interatomic distances (Angstrom).

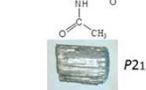

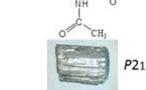

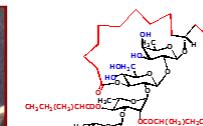

Electron are the scattering elements of the incident X-ray

Nuclei are the scattering elements of the incident Neutron radiation

Single crystals usually grown by slow evaporation of saturated solution under well controlled environments.

X-ray: Dimensions 0.2 – 0.5 mm / Synchrotron X-ray : 20-30 µm  
Neutron: Dimensions over 1.0 mm all dimensions

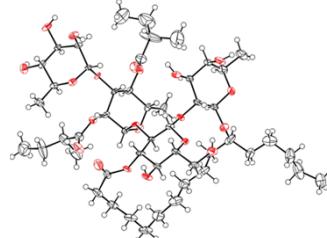

## Molecular & Crystal Structures of Carbohydrates

### Crystalline Conformations of Oligosaccharides

Cambridge Structural Data Base (CSDB) 4000 entries

Unsubstituted disaccharides 60 structures  
 Unsubstituted trisaccharides 30 structures  
 Unsubstituted tetraccharides < 5 structures

Cyclodextrins & cyclic oligoamlyoses : > 300 structures

Difficulty to crystallize oligosaccharides having molecular weight 1000 to 5000

## Understanding a Structural Report

Unit Cell Parameters (a, b, c,  $\alpha$ ,  $\beta$ ,  $\gamma$ ); Space Group

Fractional atomic coordinates content of the asymmetric unit: (x/a; y/b; z/c)  
 Anisotropic Temperature Factors (ORTEP representation ellipsoids)

Bond distances (esds), Bond angles (esds), Torsion angles (esds)  
 Geometry and conformation of the molecule

### Configuration !!!!!

Intra- and Inter molecular hydrogen bonds

Analysis of  
 Hydration features  
 Packing features

Johannes Bijvoet

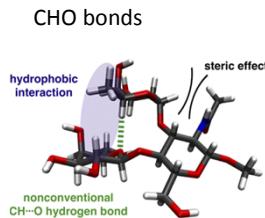

## Molecular & Crystal Structures of Carbohydrates

### Hydrogen Bonding in Crystalline Oligosaccharides

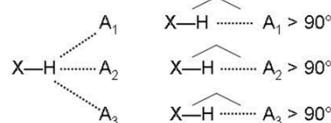

Analysis of high accurate X-ray analysis – Neutron diffraction

$$\begin{aligned} dX-dN = (C-H) &= -0.096(7) \\ dX-dN = (O-H) &= -0.155(10) \end{aligned}$$

$$X-H \cdots A \sim 160^\circ \pm 20^\circ$$

$$\alpha + \theta + \theta' \sim 360^\circ$$

$$X-H \cdots A_1 > 90^\circ$$

$$X-H \cdots A_2 > 90^\circ$$

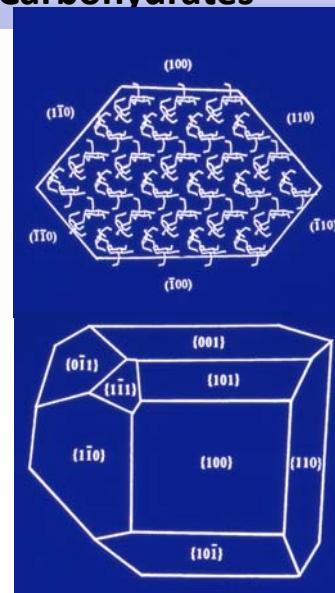

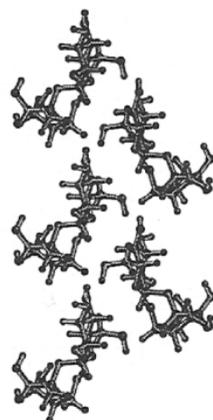

$$X-H \cdots A_3 > 90^\circ$$

Maximize the Hydrogen Bond interactions throughout the participation of all hydroxyl groups and as many rings oxygen. Two and three-centered bonds

Maximize cooperativity by forming as many finite and infinite chains of hydrogen bonds as possible.

## Crystalline Conformations of Polysaccharides

X-Ray Fiber Diffraction using Synchrotron and Neutron Radiations

The figure consists of three panels. On the left is a 3D molecular model of a polysaccharide chain with red oxygen atoms labeled 'OH'. In the center is a circular X-ray diffraction pattern with concentric rings, labeled 'OD' at the top right. On the right is a 3D ball-and-stick model of a glucose molecule, showing its carbon and oxygen atoms. The oxygen atoms are labeled O<sub>2o</sub>, O<sub>3o</sub>, and O<sub>6o</sub>. The entire figure is set against a white background.

Y. Nishiyama et al., 2002, J. Am. Chem. Soc., 124, 9074-9082

## Crystalline Conformations of Polysaccharides

### Electron Diffraction of Polysaccharides

**Electrons are charged particles** and interact with matter through the Coulomb forces. The incident electrons feel the influence of both the positively charged atomic nuclei and the surrounding electrons.

Electron diffraction of solids is usually performed in a **Transmission Electron Microscope** (TEM) where the electrons pass through a thin film of the material to be studied. The resulting diffraction pattern is then observed on a fluorescent screen, recorded on photographic film, on imaging plates or using a CCD camera.

**Electron diffraction in TEM is subject to several important limitations.**

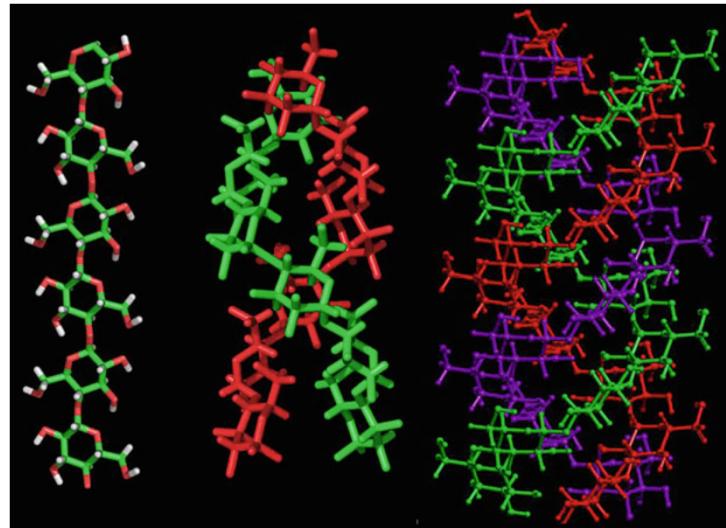

The sample to be studied must be electron transparent, meaning the sample thickness must be of the order of 100 nm or less.

- Careful and time consuming sample preparation are needed.
- Many samples are vulnerable to radiation damage caused by the incident electrons.

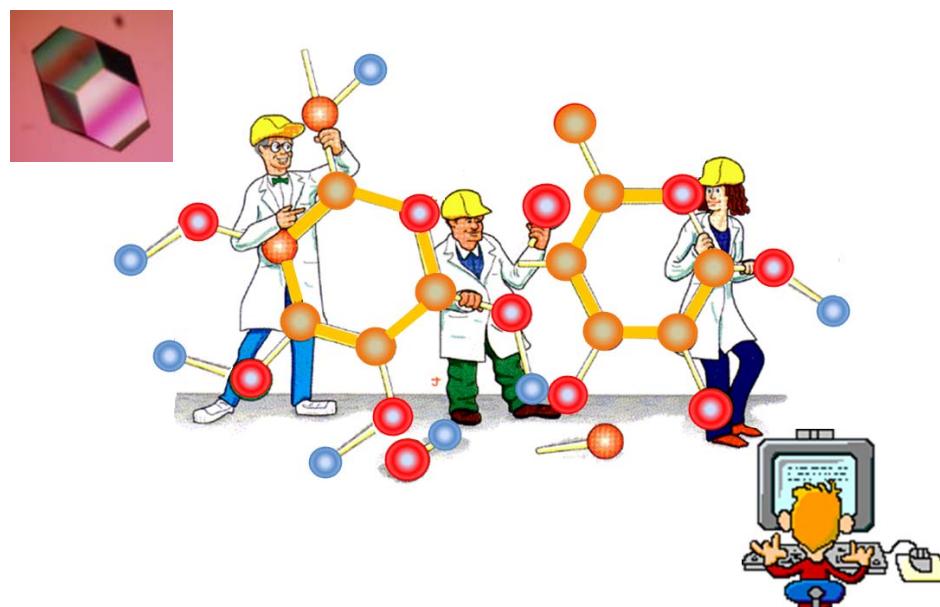

(A)

(B)

## Helical Structures of Polysaccharides

## From *in cubo* to *in silico*

## Conformational Space of Oligosaccharides

**Combinatorial building**

**Assumption:**  
Because of the bulky and (almost) rigid nature of the monosaccharide unit, the conformation of each linkage is independent on the other

**Methods :**  
Combine the lowest energy minima of each disaccharide map

**Not true for**  
- long range interactions  
- branched structures  
....

**But very useful for building starting structures!**

## Conformational Space of Flexible Oligosaccharides

Systematic search of all possible conformations ?

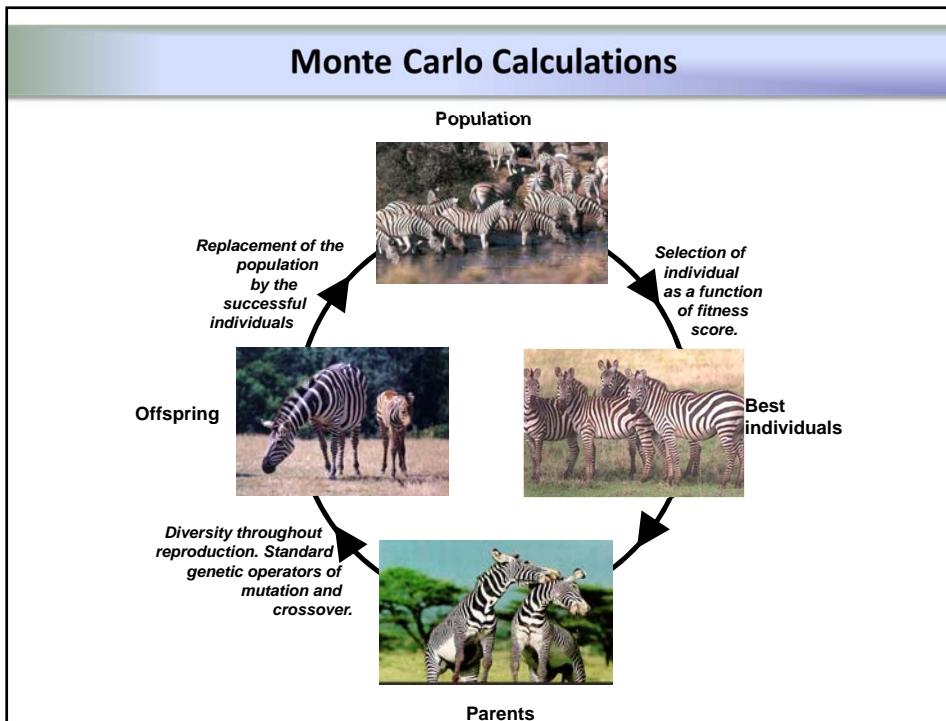

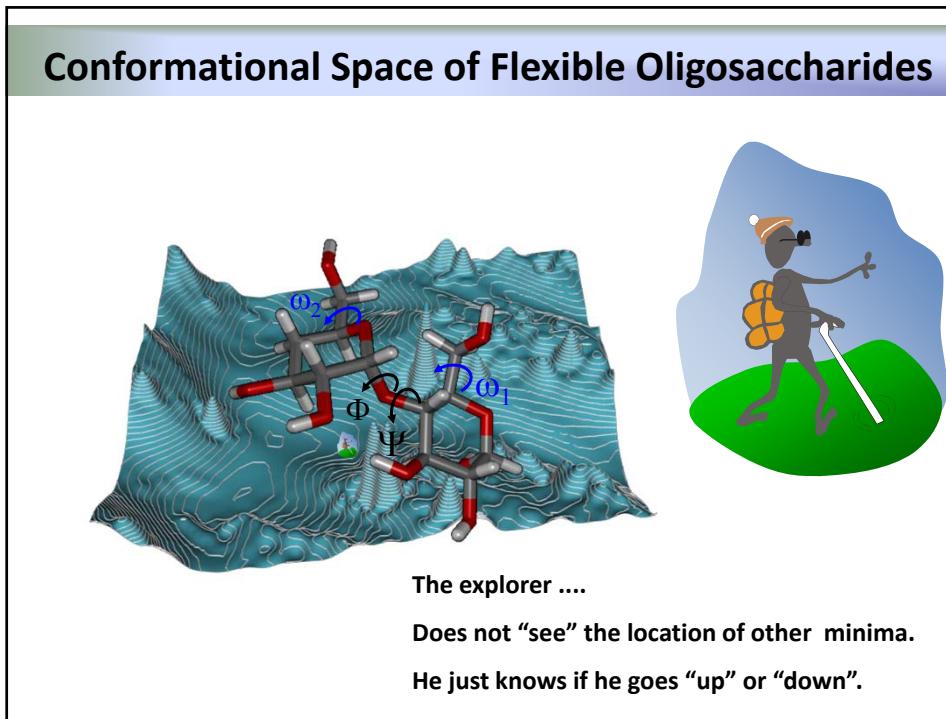

For a trisaccharide:

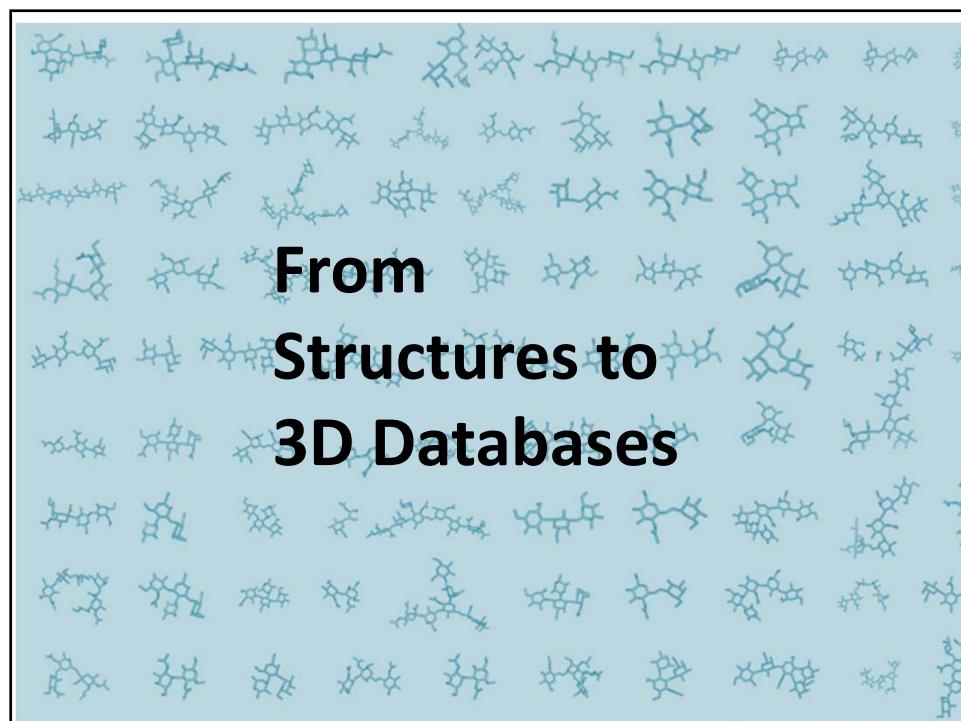

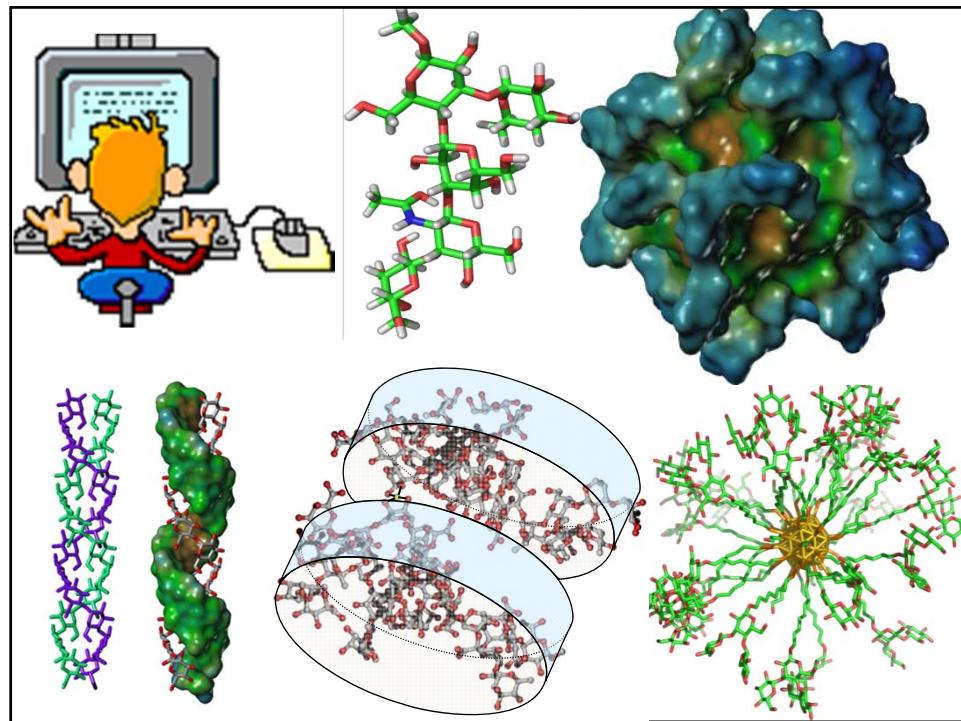

**4 torsions to be searched**  
with  $20^\circ$  steps  
 $18^4$  conformations

**12 pendant groups**  
Staggered orientations:  
 $3^{12}$  combinations

**$> 5 \cdot 10^{10}$**

$\alpha\text{Gal}(1\text{-}3)\beta\text{Gal}(1\text{-}4)\beta\text{GlcNAc}$

## Glycoinformatics

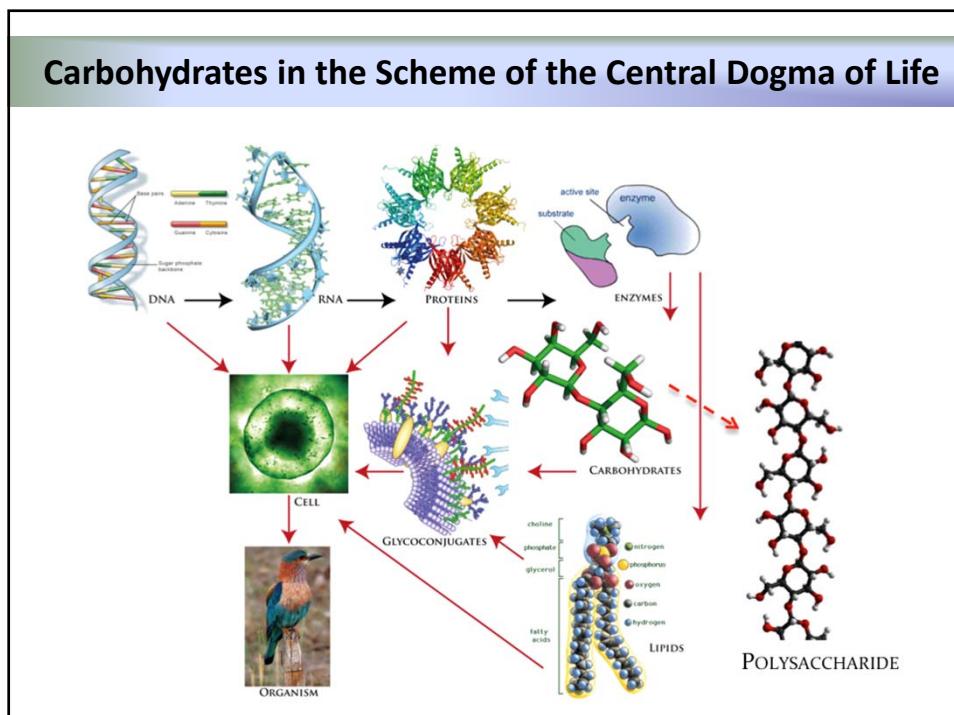

### Genomics

The screenshot shows the NCBI UniGene search interface. The top navigation bar includes links for 'Search', 'Database', 'Tools', 'Help', and 'Logout'. Below this, there's a search bar with the word 'Blast' and a dropdown menu. The main content area displays a table of search results with columns for 'Name', 'Description', 'Score', 'E-value', and 'Link'. A detailed description of the 'Blast' program is provided below the table.

### Proteomics

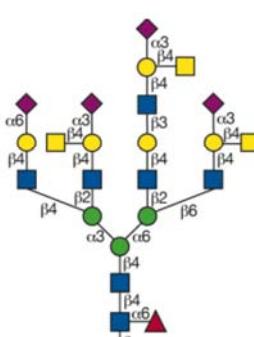

The screenshot shows the Mascot search results page from the ExPASy website. It features a header with 'ExPASy Home page', 'Site Map', 'Search ExPASy', 'Contact us', 'PROSITE', and 'Proteomics tools'. Below this is a 'Mascot Search Results' section with a histogram of probability-based scores and a table of protein matches. The table includes columns for 'Protein name', 'Uniprot ID', 'Protein score', 'Significance threshold p', and 'Max. number of hits'.

### Extending the Symbolic Representation of Monosaccharides

**Residue Letter Name:** Rib, Ara, Xyl, Lyx, All, Alt, Glc, Man, Gul, Ido, Gal, Tal,....  
 [O-ester and ethers]: (when present) are shown attached to the symbol with a number, e.g.  
 6Ac for 6-O-acetyl group, 3S for 3-O-sulfate group  
 6P for 6-O-phosphate group, 6Me for 6-O-Methyl group  
 36Anh for 3,6-anhydro, Pyr for pyruvate group

#### Absolute Configuration: D or L

The D-configuration for monosaccharides and the L configuration for Fucose and Idose are implicit and does not appear in the symbol. Otherwise the L configuration, is indicated in the symbol, as in the case of Arabinose or L-Galactose.

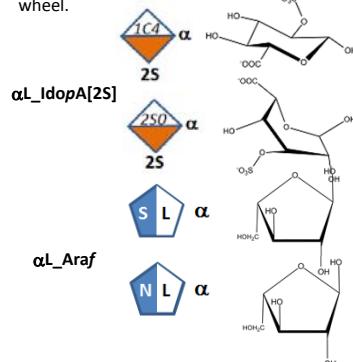

For those occurring in the furanose form, a letter N or S is inserted in the symbol, indicating the northern (N) or Southern (S) conformation of the five membered ring.

#### Anomeric Configuration.

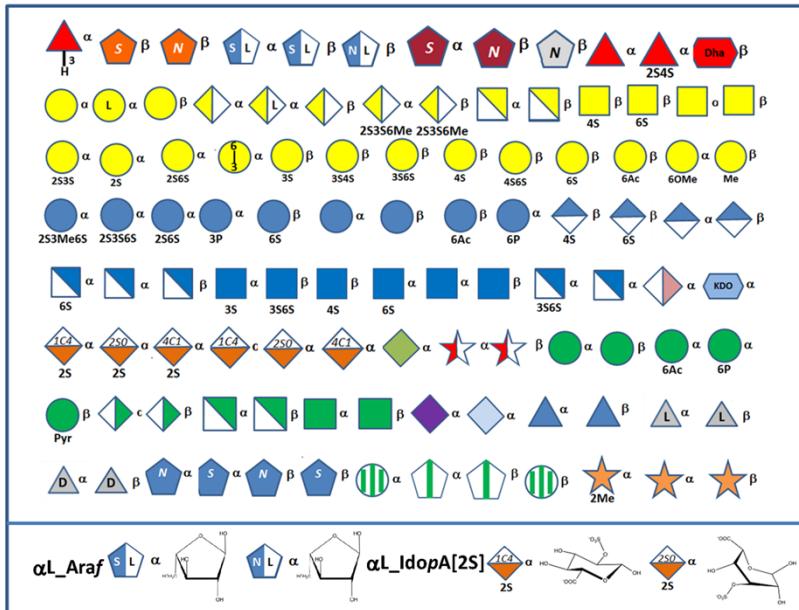

The nature of the glycosidic configuration ( $\alpha$  or  $\beta$ ) is explicitly set within the symbol.

#### Ring Conformation.

All pyranoses in the D-configuration are assumed to have  $^4C_1$  chair conformation; those in the L configuration are assumed to have  $^1C_4$  chair conformation. Otherwise, the ring conformation is indicated in the symbol, as  $^2S_0$  in the case of  $\alpha$ -L-Idopyranose. N or S indicates the conformation of the five membered rings on the conformational wheel.
